

Preface

I am very happy to share the notes that I've been writing for our class sessions. Note that these notes are a combination of materials from the books I've recommended (*and some others such as my own undergrad Linear Algebra or Calculus books that I've not listed*), online resources on particular concepts (*sometimes they explain things better than any book!*), some math review notes from past instructors, as well as materials that I've pulled from my own micro class notes (*I didn't formally ask for the professors' permission, but I think it's cool as long as we keep everything inside the classroom*).

That being said, there is bound to be mistakes in the notes. When you are taking micro, do not be surprised that even the professors have errors, in the notes that they've used for many many years, that have gone unnoticed... wrong directions of inequalities, something missing in definitions, a minus sign missing here and there, a wrong derivation when solving a problem, etc. I am happy to correct them if you notice them or when we catch them during the class sessions. I try my absolute best to correct those when writing and editing, but something always inevitably slips.

Other than that, please use them as you need. They are here to help you in these three weeks and if you need them in the future as a reference.

Thanks,
Vane
