#### **APEC Math Review**

#### Part 7 Linear Algebra

Ling Yao

August, 2020

## 1. Solving linear systems

## **Linear systems**

A linear system of *m* equations in *n* unknowns takes the form:

$$a_{11}x_1 + a_{12}x_2 + \cdots + a_{1n}x_n = b_1$$
  
 $a_{12}x_1 + a_{22}x_2 + \cdots + a_{2n}x_n = b_2$   
 $\vdots$   
 $a_{m2}x_1 + a_{m2}x_2 + \cdots + a_{mn}x_n = b_m$ 

#### Gaussian elimination

Linear systems can be solved by substitutions and eliminations. e.g.

$$x_1 - 0.4x_2 - 0.3x_3 = 130$$
$$-0.2x_1 + 0.88x_2 - 0.14x_3 = 74$$
$$-0.5x_1 - 0.2x_2 + 0.95x_3 = 95$$

$$\rightarrow$$

$$x_1 - 0.4x_2 - 0.3x_3 = 130$$
  
 $0.8x_2 - 0.2x_3 = 100$   
 $0.7x_3 = 210$ 

$$\rightarrow$$

$$x_1 = 300$$
  
 $x_2 = 200$   
 $x_3 = 300$ 

## **Elementary row operations**

Alternatively, we can use elementary row operations to solve the linear system.

First, obtain the augmented matrix

$$\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} & | & b_1 \\ a_{12} & a_{22} & \cdots & a_{2n} & | & b_2 \\ \vdots & \vdots & \ddots & \vdots & | & \vdots \\ a_{m2} & a_{m2} & \cdots & a_{mn} & | & b_m \end{pmatrix}$$

Next, do the following **elementary row operations** until the matrix is in the **row echelon form**.

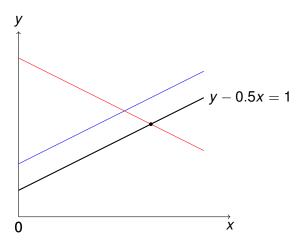

- interchange two rows
- change a row by adding to it a multiple of another row
- multiply each element in a row by the same nonzero number

## **Elementary row operations**

e.g.  $\begin{pmatrix} 1 & -0.4 & -0.3 & | & 130 \\ -0.2 & 0.88 & -0.14 & | & 74 \\ -0.5 & -0.2 & 0.95 & | & 95 \end{pmatrix}$  $\begin{pmatrix} 1 & -0.4 & -0.3 & | & 130 \\ 0 & 0.8 & -0.2 & | & 100 \\ 0 & 0 & 0.7 & | & 210 \end{pmatrix}$  $\begin{pmatrix} 1 & -0.4 & -0.3 & | & 130 \\ 0 & 1 & -0.25 & | & 125 \\ 0 & 0 & 1 & | & 300 \end{pmatrix}$  $\begin{pmatrix}
1 & 0 & 0 & | & 300 \\
0 & 1 & 0 & | & 200 \\
0 & 0 & 1 & | & 300
\end{pmatrix}$ 

## The existence of solution(s)

Consider a two equations system.

How do we know whether a linear system has one solution, no solution or infinitely many solutions?

#### Rank

The **rank** of a matrix is the number of nonzero rows in its row echelon form.

- rank **A** = rank **A**' ≤ min(#rows, #columns)
- $rankAB \le min(rankA, rankB)$
- rankA = rankA'A = rankAA'
- A matrix is full rank if the rank equals to the number of columns.

Let  $\bf A$  be the coefficient matrix and  $\hat{\bf A}$  be the corresponding augmented matrix,

- rank A < number of rows of A</li>
- rank A ≤ number of columns of A
- $rank\hat{\mathbf{A}} \geq rank\mathbf{A}$

## The existence of solution(s)

A system of linear equations with coefficient matrix  ${\bf A}$  and augmented matrix  ${\hat {\bf A}}$  has a solution iif

$$rank\hat{\mathbf{A}} = rank\mathbf{A}$$

That is, no augmented matrix like this form

$$\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} & | & b_1 \\ 0 & a_{22} & \cdots & a_{2n} & | & b_2 \\ \vdots & \vdots & \ddots & \vdots & | & \vdots \\ 0 & 0 & \cdots & 0 & | & b_m \end{pmatrix}$$

#### **Exercise**

(Simon & Blume Exercise 7.18) For what values of the parameter *a* does the following system of equations have a solution?

$$6x + y = 7$$
$$3x + y = 4$$
$$-6x - 2y = a$$

## The existence of solution(s)

A linear system has infinitely many solutions if

number of rows of  $\mathbf{A}$  < number of columns of  $\mathbf{A}$ .

A linear system has one and only one solution for every choice of right-hand side  $b_1, \dots, b_m$  iif

number of rows of  $\mathbf{A} = \text{number of columns of } \mathbf{A} = \text{rank} \mathbf{A}$ 

Such a coefficient matrix **A** is called a **nonsingular square matrix**.

## Linear independence

A **homogeneous** system, which has  $b_i = 0$  for all i,

$$\mathbf{A}\begin{pmatrix} x_1 \\ \vdots \\ x_n \end{pmatrix} = \mathbf{0}$$

is guaranteed to have at least one solution:  $x_i = 0$  for all i.

But iif there is a nonzero solution (which means there is infinitely more), each column vectors  $\mathbf{a}_1, \cdots, \mathbf{a}_n$  in A are **linearly dependent**. This means at least one of the column vectors can be written as **linear combination** of the others

A set of vector is **linearly independent** if and only if the only solution is the zero solution.

## Linear independence

If **A** is square, having a nonzero solution means **A** is singular. If **A** has more columns than rows (i.e. **A** is **short rank**), then the columns must linearly dependent.

## **Linear implicit function**

Sometimes the equations are implicit form. Let  $x_1, \dots, x_k$  and  $x_{k+1}, \dots, x_n$  be a partition of the n variables in the linear system into endogenous and exogenous variables, respectively. There is, for each choice of values for the endogenous variables, a unique set of values for the exogenous variables, which solves the system iif

- **1** k = m (# endogenous variables = # equations) and
- 2 the rank of the coefficient matrix

$$\begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1k} \\ a_{12} & a_{22} & \cdots & a_{2k} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m2} & a_{m2} & \cdots & a_{mk} \end{pmatrix}$$

corresponding to the endogenous variables, is k.

#### **Exercise: structural and reduced form**

(Simon & Blume, Exercise 7.25)

For the following system, separate the variables into exogenous and endogenous ones so that each choice of values of the exogenous variables determines unique values for the endogenous variables. Also, find an explicit formula for the endogenous variables in terms of the exogenous ones.

$$x + 2y + z - w = 1$$
$$3x - y - z - 3w = 3$$
$$y + z + w = 0$$

# 2. Square matrices

## **Square matrices**

Linear systems can also be solved with matrix inversion if the number of unknowns is the same as the number of equations, that is, the coefficient matrix is square and nonsingular.

#### **Inversion**

Let  $\mathbf{B} = \mathbf{A}^{-1}$  be the inverse of a full-rank  $k \times k$  matrix  $\mathbf{A}$ . The matrices satisfy

$$AB = I_k$$

If an  $n \times n$  matrix **A** is invertible, then it is nonsingular, and the unique solution to the linear system  $\mathbf{A}\mathbf{x} = \mathbf{b}$  is  $\mathbf{x} = \mathbf{A}^{-1}\mathbf{b}$ .

#### **Inversion**

The following statements about a  $n \times n$  square matrix **A** are equivalent

- A is invertible
- A is nonsingular
- A has maximal rank *n* (full rank)
- every system Ax = b has one and only one solution for every b

#### **Determinant**

A  $n \times n$  square matrix **A** is nonsingular if and only if its **determinant** is nonzero.

$$det \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} or \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$= a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32}$$

$$- a_{13}a_{22}a_{31} - a_{21}a_{12}a_{33} - a_{11}a_{23}a_{32}$$

- $det \mathbf{A}^T = det \mathbf{A}$
- det (**A** · **B**) = det **A** · det **B**
- $det(\mathbf{A} + \mathbf{B}) \neq det \mathbf{A} + det \mathbf{B}$

What will happen if A is not full rank?

#### **Inversion**

Let **A** and **B** be square invertible matrices. Then,

- 1 det A and det B are nonzero
- $(A^{-1})^{-1} = A$
- $(\mathbf{A}^{\mathsf{T}})^{-1} = (\mathbf{A}^{-1})^{\mathsf{T}}$
- **4 AB** is invertible, and  $(AB)^{-1} = B^{-1}A^{-1}$

#### **Inversion**

Let A be a nonsingular matrix,

$$\mathbf{A}^{-1} = \frac{1}{\det \mathbf{A}} \cdot \operatorname{adj} \mathbf{A},$$

where  $adj \mathbf{A}$  is a  $n \times n$  square matrix in which the element on the ith row and j the column is

 $(-1)^{i+j} \times det(submatrix\ of\ \mathbf{A}\ without\ the\ ith\ row\ and\ the\ jth\ column)$ 

#### **Exercise: matrix inversion**

Invert the following matrix

$$\begin{pmatrix} 1 & 2 & 3 \\ 0 & 5 & 6 \\ 1 & 0 & 8 \end{pmatrix}$$

#### Cramer's rule

The unique solution 
$$\mathbf{x} = (x_1, \dots, x_n)$$
 of the  $n \times n$  system  $\mathbf{A}\mathbf{x} = \mathbf{b}$  is  $x_i = \frac{\det \mathbf{B}_i}{\det \mathbf{A}}$  for  $i = 1, \dots, n$ ,

where  $\mathbf{B}_i$  is the matrix  $\mathbf{A}$  with the right-hand side  $\mathbf{b}$  replacing the *i*th column of  $\mathbf{A}$ .

#### **Exercise: Cramer's rule**

Use the Cramer's rule to calculate  $x_3$  in the following system:

$$\begin{pmatrix} 1 & 1 & 1 \\ 12 & 2 & -3 \\ 3 & 4 & 1 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix} = \begin{pmatrix} 0 \\ 5 \\ -4 \end{pmatrix}$$

#### **Trace**

The trace of a  $k \times k$  square matrix **A** is the sum of its diagonal elements

$$tr(\mathbf{A}) = \sum_{i=1}^{k} a_{ii}$$

#### **Properties**

- $tr(c\mathbf{A}) = c tr(\mathbf{A})$
- $tr(\mathbf{A}') = tr(\mathbf{A})$
- $tr(\mathbf{A} + \mathbf{B}) = tr(\mathbf{A}) + tr(\mathbf{B})$
- $tr(\mathbf{I}_k) = k$
- for  $k \times r$  **A** and  $r \times k$  **B**, tr(AB) = tr(BA)

## **Characteristic equation**

For a square matrix **A**, we can define a set of equations

$$\mathbf{Ac} = \lambda \mathbf{c}$$

The pairs of solutions  $(\mathbf{c}, \lambda)$  are the **characteristic vectors** (eigenvectors)  $\mathbf{c}$  and **characteristic roots** (eigenvalues)  $\lambda$ . The equations imply that

$$\mathbf{Ac} = \lambda \mathbf{Ic} \Leftrightarrow (\mathbf{A} - \lambda \mathbf{I})\mathbf{c} = \mathbf{0}$$

This homogeneous system has a nonzero solution only if  $(\mathbf{A} - \lambda \mathbf{I})$  is singular and has zero determinant.

This polynomial of  $\lambda$  is the characteristic equation.

# **Exercise: characteristic equation**

$$\frac{\lambda^{2} + \lambda + 1}{4} = 6 + \frac{1}{4} \qquad \qquad \lambda + \frac{1}{2} = \pm \frac{5}{2}$$

$$(\lambda + \frac{1}{2})^{2} = \frac{25}{4} \qquad \qquad \lambda = -3 \text{ or } 2$$
Solve for the characteristic roots for the following matrix.

Solve for the characteristic roots for the following matrix.

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -$$

Solve for the characteristic roots for the following matrix.

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -1 & 3 \\ 2 & 0 \end{pmatrix}$$

$$A = \begin{pmatrix} -$$

#### **Characteristic vectors**

With the characteristic roots, we can solve for the characteristic vectors corresponding to each characteristic roots using

$$(\mathbf{A} - \lambda \mathbf{I})\mathbf{c} = \mathbf{0}$$

 $(\mathbf{A} - \lambda \mathbf{I})$  is singular so there exists a non-zero solution. In fact, there are infinite nonzero solutions, just pick one that is nonzero. Normalize it so that  $\mathbf{c}'\mathbf{c} = \mathbf{1}$ :

Solve for the two characteristic vectors in the last example.

### Some useful results

- A k × k matrix has k distinct characteristic vectors that are orthogonal to each other.
- The rank of a symmetric matrix is the number of nonzero characteristic roots it contains.
- The trace of a matrix equals the sum of its characteristic roots.
- The determinant of a matrix equals the product of its characteristic roots.

 If A<sup>-1</sup> exists, then the characteristic roots of A<sup>-1</sup> are the reciprocals of those of A and the characteristic vectors are the same.

## **Decomposition**

#### Define

$$\mathbf{C} = (\mathbf{c_1} \quad \mathbf{c_2} \quad \cdots \quad \mathbf{c_k})$$

$$\begin{pmatrix} \lambda_1 & 0 & \cdots & 0 \\ 0 & \lambda_2 & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \lambda_k \end{pmatrix}$$

For each k

$$\mathbf{Ac_k} = \lambda_\mathbf{k} \mathbf{c_k}$$

So

$$AC = C\Lambda$$

## **Decomposition**

Because the vectors are orthogonal and  $\mathbf{c}_i'\mathbf{c}_i=\mathbf{1}$ 

$$\mathbf{C}'\mathbf{C} = \mathbf{I}$$

So

$$\label{eq:continuity} \begin{split} \mathbf{C}' &= \mathbf{C}^{-1}, \\ \mathbf{CC}' &= \mathbf{CC}^{-1} = \mathbf{I}. \end{split}$$

The diagonalization of a matrix A is

$$C'AC = C'C\Lambda = I\Lambda = \Lambda$$

The spectral decomposition of **A** is

$$\mathbf{A} = \mathbf{C} \mathbf{\Lambda} \mathbf{C}' = \sum_{i=1}^{k} \lambda_i \mathbf{c_i} \mathbf{c_i'}$$

#### **Definite matrices**

How do we know if a symmetric matrix **A** is positive or negative (semi)definite or indefinite?

We know a symmetric matrix can be decomposed into

### **Definite matrices**

- A is positive (negative) definite if and only if all the characteristic roots of A are positive (negative).
- A is positive (negative) semidefinite if and only if all the characteristic roots are ≥ 0 (≤ 0).
- A is indefinite if and only if A has both positive and negative characteristic roots.

#### Some results related to definiteness

If **X** is any  $N \times K$  matrix, the symmetric  $K \times K$  matrix **X**'**X** is positive definite, if and only if  $N \geq K$  and  $rank(\mathbf{X}) = K$ .

To see this, define a  $N \times 1$  vector

$$\mathbf{p} = \mathbf{X}\mathbf{z}$$

for any  $K \times 1$  vector  $\mathbf{z} \neq \mathbf{0}$ . Then

$$\mathbf{z}'\mathbf{X}'\mathbf{X}\mathbf{z} = \mathbf{p}'\mathbf{p} = \sum_{i=1}^{N} p_i^2 \ge 0$$

$$rank(\mathbf{X}'\mathbf{X} = K) \Leftrightarrow rank(\mathbf{X} = K)$$

 $\Leftrightarrow$  There can exist no  $\mathbf{z} \neq \mathbf{0}$  such that  $\mathbf{p} = \mathbf{X}\mathbf{z} = \mathbf{0}$  (Recall the rank condition for a homogeneous system to have nonzero solution).

$$\Leftrightarrow \sum_{i=1}^{N} p_i^2 \neq 0$$

$$\Leftrightarrow$$
  $\mathbf{z}'\mathbf{X}'\mathbf{X}\mathbf{z} = \mathbf{p}'\mathbf{p} > 0$  (matrix  $\mathbf{X}'\mathbf{X}$  is positive definite)

#### **Exercise**

Using a similar proof as in the last slide, show that if  $\mathbf{X}$  is any  $N \times K$  matrix, the symmetric  $N \times N$  matrix  $\mathbf{XX'}$  is positive semidefinite if and only if  $N \geq K$  and  $rank(\mathbf{X}) = K$ .

# Another way to test definiteness: leading principle minors

Let **A** be an  $N \times N$  matrix. The Kth order principal submatrix of **A** obtained by deleting the last N - K rows and the last N - K columns is called the Kth order leading principal submatrix. Its determinant is call the Kth order leading principal minor.

E.g. for a  $3 \times 3$  matrix, the three leading principal minors are

$$\begin{vmatrix} a_{11} \end{vmatrix}$$
,  $\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix}$ ,  $\begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$ .

## Another way to test definiteness: leading principle minors

Let **A** be an  $N \times N$  matrix.

- A is positive definite (semidefinite) if and only if all its N leading principal minors > 0 (≥ 0).
- A is negative definite if and only if its N leading principle minors alternate in sign as follows:

$$|A_1| < 0$$
,  $|A_2| > 0$ ,  $|A_3| < 0$ , etc.

(Negative semidefinte if the inequalities are weak.)

 A is indefinite if the leading principal minors follow other patterns.

#### 3. Matrix calculus

### **System of equations**

We have reviewed functions with one dependent variable. Now we turn to functions with several dependent variables. A function from  $\mathbb{R}^n$  to  $\mathbb{R}^m$  is

$$q_1 = f_1(x_1, \dots, x_n)$$

$$q_2 = f_2(x_1, \dots, x_n)$$

$$\vdots$$

$$q_m = f_m(x_1, \dots, x_n)$$

We can write this as

$$F(\mathbf{x}) = (f_1(x_1, \dots, x_n), f_2(x_1, \dots, x_n), ..., f_m(x_1, \dots, x_n)).$$

#### First derivative

The Jacobian matrix is  $m \times n$ 

$$\begin{pmatrix} \frac{\partial f_1}{\partial x_1} & \frac{\partial f_1}{\partial x_2} & \cdots & \frac{\partial f_1}{\partial x_n} \\ \frac{\partial f_2}{\partial x_1} & \frac{\partial f_2}{\partial x_2} & \cdots & \frac{\partial f_2}{\partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial f_m}{\partial x_1} & \frac{\partial f_m}{\partial x_2} & \cdots & \frac{\partial f_m}{\partial x_n} \end{pmatrix}$$

#### **Linear functions**

In a set of linear functions

$$y = Ax$$

each element  $y_i$  of  $\mathbf{y}$  is

$$y_i = \mathbf{a}_i' \mathbf{x},$$

where a' is the ith row of A. Therefore,

$$\frac{\partial y_i}{\partial \mathbf{x}} = \frac{\partial}{\partial \mathbf{x}} (\mathbf{a_i'x}) = \mathbf{a_i} = \textit{transpose of ith row of } \mathbf{A},$$

and

$$\begin{pmatrix} \left(\frac{\partial y_1}{\partial \mathbf{x}}\right)' \\ \left(\frac{\partial y_2}{\partial \mathbf{x}}\right)' \\ \vdots \\ \left(\frac{\partial y_m}{\partial \mathbf{x}}\right)' \end{pmatrix} = \begin{pmatrix} \mathbf{a_1'} \\ \mathbf{a_2'} \\ \vdots \\ \mathbf{a_m'} \end{pmatrix}$$

Collecting all terms, we find that  $\frac{\partial}{\partial \mathbf{x}}(\mathbf{A}\mathbf{x}) = \mathbf{A}$ 

#### **Exercise**

Show that 
$$\frac{\partial}{\partial \mathbf{x}}(\mathbf{x}'\mathbf{a_i}) = \mathbf{a_i}$$
 and  $\frac{\partial}{\partial \mathbf{x}}(\mathbf{x}'\mathbf{A}') = \mathbf{A}'$ .

#### **Product rule**

Let **a** and **b** be  $n \times 1$  vectors. Both are functions of the vector **x**. Show that

$$\frac{\partial \textbf{a}'\textbf{b}}{\partial \textbf{x}} = \frac{\partial \textbf{a}'}{\partial \textbf{x}}\textbf{b} + \frac{\partial \textbf{b}'}{\partial \textbf{x}}\textbf{a}$$

#### **Quadratic form**

$$\mathbf{x}'\mathbf{A}\mathbf{x} = \sum_{i=1}^{n} \sum_{j=1}^{n} x_i x_j a_{ij}$$

Notice that  $\mathbf{x}'\mathbf{A}\mathbf{x} = \mathbf{x}'\mathbf{A}'\mathbf{x}$ . By the product rule,

$$\begin{split} \frac{\partial}{\partial x}(x'Ax) &= \frac{\partial}{\partial x}(x'I_k)Ax + \frac{\partial}{\partial x}(x'A')x = I_kAx + A'x = (A+A')x \\ &\frac{\partial^2}{\partial x\partial x'}(x'Ax) = A + A' \end{split}$$

## **Approximation by differentials**

$$F(\mathbf{x}^* + \Delta \mathbf{x}) - F(\mathbf{x}^*) pprox \underbrace{ \begin{bmatrix} rac{\partial f_1}{\partial \chi_1}(\mathbf{x}^*) & \dots & rac{\partial f_1}{\partial \chi_n}(\mathbf{x}^*) \\ \vdots & \ddots & \vdots \\ rac{\partial f_m}{\partial \chi_1}(\mathbf{x}^*) & \dots & rac{\partial f_m}{\partial \chi_n}(\mathbf{x}^*) \end{bmatrix} }_{ ext{Jacobian derivative}} \begin{bmatrix} \Delta \chi_1 \\ \vdots \\ \Delta \chi_n \end{bmatrix}$$

For a linear econometric model, we can estimate a vector of coefficients  $\mathbf{b}$  that has the mean of  $\beta$  and variance-covariance matrix  $(Asy.Var[\mathbf{b}])$ .

$$\mathbf{b} \stackrel{a}{\sim} N[\beta, Asy. Var[\mathbf{b}]]$$

We can estimate  $Asy.Var[\mathbf{b}]$ . But sometimes we are interested in the variance of a function of  $\mathbf{b}$ ,  $f(\mathbf{b})$ .

For example (Greene, page 80),

$$In(\frac{Q}{Pop})_{t} = \beta_{1} + \beta_{2}InP_{G,t} + \beta_{3}In(\frac{Income}{Pop})_{t} + \beta_{4}InP_{nc,t} + \beta_{5}InP_{uc,t} + \gamma In(\frac{G}{Pop})_{t-1} + \varepsilon_{t}$$

 $b_2$  and  $b_3$  are the estimates for the short-run price and income elasticities  $\beta_2$  and  $\beta_3$ , but we are also interested in the long term elasticities  $\phi_2 = \beta_2/(1-\gamma)$ ,  $\phi_3 = \beta_3/(1-\gamma)$ .

The linear approximation tells us

$$f(\mathbf{b}) pprox f(eta) + rac{\partial f(eta)}{\partial eta} (\mathbf{b} - eta)$$

Recall that  $Var(ax + b) = a^2 Var(x)$ . Similarly,

$$Asy.Var[f(\mathbf{b})] = \left(\frac{\partial f(\boldsymbol{\beta})}{\partial \boldsymbol{\beta}}\right) Asy.Var[\mathbf{b}] \left(\frac{\partial f(\boldsymbol{\beta})}{\partial \boldsymbol{\beta}}\right)'$$

In our example,

$$\frac{\partial \phi_2}{\partial \boldsymbol{\beta}} = \begin{pmatrix} 0 & \frac{1}{1-\gamma} & 0 & 0 & 0 & \frac{\beta_2}{(1-\gamma)^2} \end{pmatrix}$$

Write out the Jacobian for  $\phi_3$ .

Finally we can estimate the variance for the long term elasticities  $\phi_2$  and  $\phi_3$ :

$$extit{Asy.Var}[\phi_2] = \Big(rac{\partial \phi_2}{\partial oldsymbol{eta}}\Big) extit{Asy.Var}[\mathbf{b}] \Big(rac{\phi_2}{\partial oldsymbol{eta}}\Big)'$$

$$extit{Asy.Var}[\phi_3] = \Big(rac{\partial \phi_3}{\partial oldsymbol{eta}}\Big) extit{Asy.Var}[\mathbf{b}] \Big(rac{\phi_3}{\partial oldsymbol{eta}}\Big)'$$

## 4. Matrix representation of regressions

## **Application: deriving the OLS estimator**

To estimate a K variables linear model with a sample of size N.

$$\mathbf{Y}_{N\times 1} = \mathbf{X}_{N\times K} \boldsymbol{\beta}_{K\times 1} + \mathbf{e}_{N\times 1}$$

Choose the  $\hat{\beta}$  that minimizes the sum of squared prediction error

$$\boldsymbol{\hat{e}}'\boldsymbol{\hat{e}} = (\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\hat{\beta}})'(\boldsymbol{Y} - \boldsymbol{X}\boldsymbol{\hat{\beta}})$$

### The normal equation

The first order condition gives us the normal equation:

$$\mathbf{X}'\mathbf{X}\hat{\boldsymbol{\beta}} - \mathbf{X}'\mathbf{Y} = \mathbf{0}$$

This means

$$-\mathbf{X}'(\mathbf{Y}-\mathbf{X}\hat{\boldsymbol{\beta}})=-\mathbf{X}'\hat{\mathbf{e}}=\mathbf{0}$$

O: In order to reach the solution

$$\hat{\boldsymbol{\beta}} = (\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'\mathbf{Y},$$

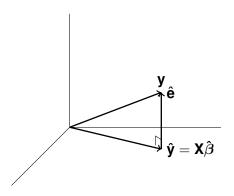

what is assumed for the **X** for the last step (rank and inner product)?

Q: Is the second order sufficient condition satisfied?

## **OLS from vector space view**

Given a  $n \times 1$  vector **y** and a  $n \times k$  matrix **X**, our goal is to find a  $k \times 1$  vector  $\hat{\beta}$  such that **y** is a linear combination of columns in **X** plus a difference:

$$\mathbf{y} = \mathbf{X}\boldsymbol{\hat{\beta}} + \mathbf{\hat{e}}$$

We want the difference  $\hat{\mathbf{e}}$  to be as short as possible, so  $\hat{\mathbf{e}}$  should be orthoronal to  $\mathbf{X}\hat{\boldsymbol{\beta}}$ 

$$\hat{\boldsymbol{\beta}}' \mathbf{X}' \cdot \hat{\mathbf{e}} = 0$$

$$= \hat{\boldsymbol{\beta}}' \mathbf{X}' (\mathbf{y} - \mathbf{X} \hat{\boldsymbol{\beta}})$$

$$= \hat{\boldsymbol{\beta}} [\mathbf{X}' \mathbf{y} - \mathbf{X}' \mathbf{X} \hat{\boldsymbol{\beta}}]$$

$$\Rightarrow \mathbf{X}' \mathbf{y} = \mathbf{X}' \mathbf{X} \hat{\boldsymbol{\beta}}$$

#### The centering matrix

In statistics, there are many cases where we need to transform the data to **deviation from their mean**. We can do it by multiplying the data matrix to a "centering matrix". First, define a  $N \times N$  matrix of  $\frac{1}{N}$ ,

$$\frac{1}{N}\mathbf{i}\mathbf{i}' = \frac{1}{N} \begin{pmatrix} 1\\1\\\vdots\\1 \end{pmatrix} \begin{pmatrix} 1 & 1 & \cdots & 1 \end{pmatrix} = \begin{pmatrix} \frac{1}{N} & \frac{1}{N} & \cdots & \frac{1}{N}\\\frac{1}{N} & \frac{1}{N} & \cdots & \frac{1}{N}\\\vdots & & & \\\frac{1}{N} & \frac{1}{N} & \cdots & \frac{1}{N} \end{pmatrix}$$

Then define a vector of means

$$\mathbf{i}\bar{\mathbf{x}} = \frac{1}{N}\mathbf{i}\mathbf{i}'\mathbf{x} = \begin{pmatrix} \frac{1}{N} & \frac{1}{N} & \cdots & \frac{1}{N} \\ \frac{1}{N} & \frac{1}{N} & \cdots & \frac{1}{N} \\ \vdots & & & \\ \frac{1}{N} & \frac{1}{N} & \cdots & \frac{1}{N} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_N \end{pmatrix} = \begin{pmatrix} \bar{x} \\ \bar{x} \\ \vdots \\ \bar{x} \end{pmatrix}$$

## The centering matrix

The vector of deviations can be written as

$$\mathbf{x} - \mathbf{i}\bar{\mathbf{x}} = \begin{pmatrix} x_1 - \bar{\mathbf{x}} \\ x_2 - \bar{\mathbf{x}} \\ \vdots \\ x_N - \bar{\mathbf{x}} \end{pmatrix} = \mathbf{x} - \frac{1}{N}\mathbf{i}\mathbf{i}'\mathbf{x} = (\mathbf{I} - \frac{1}{N}\mathbf{i}\mathbf{i}')\mathbf{x} = \mathbf{M}^0\mathbf{x}$$

The sum of deviations can be written as

$$\sum_{i=1}^{N} (x_i - x)^2 = (\mathbf{x} - i\bar{x})'(\mathbf{x} - i\bar{x}) = (\mathbf{M}^0 \mathbf{x})'(\mathbf{M}^0 \mathbf{x}) = \mathbf{x}' \mathbf{M}^{0'} \mathbf{M}^0 \mathbf{x}$$

Show that

- $\mathbf{0} \ \mathbf{M^0} \mathbf{i} = \mathbf{0}$
- **2**  $M^0$  is idempotent, that is  $M^{0'}M^0 = M^0$

#### **Exercise**

Show that in a regression with only a constant, that is, when  $\mathbf{X} = \mathbf{i}$ ,  $\hat{\boldsymbol{\beta}}$  is the mean of  $\mathbf{Y}$  and the residual  $\hat{\mathbf{e}}$  is  $\mathbf{Y}$ 's deviations from the mean.

#### The residual maker

Define

$$\mathbf{M} = \mathbf{I} - \mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}'$$

Then

$$\hat{\mathbf{e}} = \mathbf{Y} - \mathbf{X}\hat{\boldsymbol{\beta}} = (\mathbf{I} - \mathbf{X}(\mathbf{X}'\mathbf{X})^{-1}\mathbf{X}')\mathbf{Y} = \mathbf{M}\mathbf{Y}$$

**M** is called the "residual maker". Show that it is symmetric and idempotent.

## **Partitioned regression**

Suppose the regression involves two sets of variables:

$$\boldsymbol{X} = [ \boldsymbol{X_1} \quad \boldsymbol{X_2} ].$$

So that

$$Y = X_1\beta_1 + X_2\beta_2 + e$$

Define

$$\begin{split} &M_1 = I - X_1 (X_1' X_1)^{-1} X_1' \\ &M_2 = I - X_2 (X_2' X_2)^{-1} X_2' \end{split}$$

Write out the expression for  $\hat{\beta}_1$  and  $\hat{\beta}_2$  separately.
